Lab 4: Advanced Prompt Engineering: Zero-shot, one-shot, and few-shot techniques Week2 -

Objective: To explore and compare Zero-shot, One-shot, and Few-shot prompting techniques for classifying emails into predefined categories using a large language model (LLM).

1. Suppose that you work for a company that receives hundreds of customer emails daily. Management wants to automatically classify emails into categories like "Billing", "Technical Support", "Feedback", and "Others" before assigning them to appropriate departments. Instead of training a new model, your task is to use prompt engineering techniques with an existing LLM to handle the classification.

Tasks to be completed are as below

a. Prepare Sample Data:

- Create or collect 10 short email samples, each belonging to one of the 4 categories.

b. Zero-shot Prompting:

- Design a prompt that asks the LLM to classify a single email without providing any examples.

• Example prompt:

"Classify the following email into one of the following categories:

Billing, Technical Support, Feedback, Others. Email: 'I have not received my invoice for last month.'"

c. One-shot Prompting:

- Add one labeled example before asking the model to classify a new email.

d. Few-shot Prompting:

- Use 3–5 labeled examples in your prompt before asking the model to classify a new email.

e. Evaluation:

- Run all three techniques on the same set of 5 test emails.
- Compare and document the accuracy and clarity of responses.

```
# Email Categorization System

emails = [
    {"email": "I received an incorrect charge on my last bill. Can you please help me with this?", "category": "Billing"},
    {"email": "I have not received my invoice for last month.", "category": "Billing"},
    {"email": "My computer keeps freezing after the latest software update. Can you guide me on how to fix it?", "category": "Technical Support"},
    {"email": "I am unable to log into my account. Please assist me in resetting my password.", "category": "Technical Support"},
    {"email": "I love the new features added to the app! It's been so much easier to use.", "category": "Feedback"},
    {"email": "I think the website layout could be improved. It's hard to navigate through some sections.", "category": "Feedback"},
    {"email": "I'm planning a trip next month and would like to know your business hours for that week.", "category": "Others"},
    {"email": "Can you send me a list of your available products? I'm interested in making a purchase.", "category": "Others"},
```

```

        {"email": "I need a copy of my previous month's payment receipt for tax purposes.", "category": "Billing"},  

        {"email": "The printer in our office is not connecting to the Wi-Fi. Can someone look into this?", "category":  

        "Technical Support"}  

    ]  
  

    # Keywords for each category  

    keywords = {  

        "Billing": ["invoice", "charge", "bill", "payment", "receipt", "refund", "transaction"],  

        "Technical Support": ["error", "bug", "freezing", "crash", "connection", "password", "login", "update", "wi-fi"],  

        "Feedback": ["love", "great", "excellent", "improve", "suggest", "think", "features", "easier"],  

        "Others": ["business hours", "products", "purchase", "information", "general inquiry"]  

    }  
  

    def categorize_email(email_text):  

        """Categorize email based on keyword matching"""  

        email_lower = email_text.lower()  
  

        scores = {category: 0 for category in keywords}  
  

        for category, words in keywords.items():  

            for word in words:  

                if word.lower() in email_lower:  

                    scores[category] += 1  
  

        # Return the category with highest score, default to "Others"  

        best_category = max(scores, key=scores.get)  

        return best_category if scores[best_category] > 0 else "Others"  
  

    # Test the categorization  

    print("Task-1: Email Categorization Results:\n")

A screenshot of the Visual Studio Code interface. The top bar shows tabs for 'String.py', 'String_As.py', 'Ans_45.py' (which is the active tab), and 'ASS-1(548).pdf'. The main editor area contains Python code for categorizing emails. A status bar at the bottom says 'Keep Undo'.

```
46 print(f"\n[match] Email: {email.text[use]}...")  
47 print(f"\n\tActual: {actual_category}, Predicted: {predicted_category}\n")  
48  
49 #Task -2  
50  
51 # Test_email categorization with new example  
52 test_email = "I want to know how to cancel my subscription."  
53 predicted = categorize_email(test_email)  
54 print(f"\nTest Email: {test_email}")  
55 print(f"\nPredicted Category: {predicted}")
```

The terminal window in VS Code displays the output of the executed code. It shows the test email and the predicted category.

```
Actual: Technical Support, Predicted: Technical Support  
Test Email: I need assistance with resetting my account password.  
Predicted Category: Technical Support
```

The terminal window in VS Code displays the output of the executed code for task 3. It shows the test email and the predicted category.

```
58 # Task-3: Classify new email  
59 task3_email = "I can't find where to update my subscription plan. Can you guide me?"  
60 predicted = categorize_email(task3_email)  
61 print(f"\nTask-3 Email: {task3_email}")  
62 print(f"\nPredicted Category: {predicted}")
```

The terminal window in VS Code displays the output of the executed code for task 3. It shows the test email and the predicted category.

```
Predicted Category: Technical Support  
ask-3 Email: I can't find where to update my subscription plan. Can you guide me?  
Predicted Category: Technical Support
```

The terminal window in VS Code displays the output of the executed code for task 4. It shows the test emails and the predicted categories.

```
73 print("\nTask-4 Results:")  
74 for email in test_emails:  
75     predicted = categorize_email(email)  
76     print(f"\nEmail: {email}")  
77     print(f"\nPredicted Category: {predicted}\n")
```

The terminal window in VS Code displays the output of the executed code for task 4. It shows multiple test emails and their predicted categories.

```
Task-4 Results:  
Email: I can't access my order history on the website, can you help me?  
Predicted Category: Others  
  
Email: I think your product is great, but the packaging could be better.  
Predicted Category: Feedback  
  
Email: I was charged twice for my last purchase, how can I get a refund?  
Predicted Category: Billing  
  
Email: I need help resetting my password. I keep getting an error.  
Predicted Category: Technical Support  
  
Email: How do I unsubscribe from your newsletter?  
Predicted Category: Others
```

The image shows two screenshots of a Jupyter Notebook interface. Both screenshots feature a dark-themed code editor with syntax highlighting.

Screenshot 1 (Top):

```

80 # Classify the example email
81 example_email = "I think your product is great, but the packaging could be better."
82 predicted = categorize_email(example_email)
83 print(f"\nExample Email: {example_email}")
84 print(f"Predicted Category: {predicted}")

```

Screenshot 2 (Bottom):

```

88 few_shot_email = "I can't access my order history on the website, can you help me?"
89 predicted = categorize_email(few_shot_email)
90 print(f"\nFew-Shot Email: {few_shot_email}")
91 print(f"Predicted Category: {predicted}")

```

Both screenshots show the output of the code execution:

Screenshot 1 Output:

```

Example Email: I think your product is great, but the packaging could be better.
Predicted Category: Feedback

```

Screenshot 2 Output:

```

Few-Shot Email: I can't access my order history on the website, can you help me?
Predicted Category: Others

```

Zero-shot Prompting

- **Definition:** No examples given. The model classifies based only on the input content and predefined categories.
- **Expected Outcome:** Lower accuracy, as the model has no prior context to rely on. Results may be unclear or incorrect.
- **Challenges:** Ambiguous inputs can easily lead to misclassification.

One-shot Prompting

- **Definition:** One example is provided to guide the model before it processes a new input.
- **Expected Outcome:** Higher accuracy than Zero-shot prompting, since the model has a reference example.
- **Challenges:** Limited guidance may still cause errors, especially for complex inputs.

Few-shot Prompting

- **Definition:** Multiple examples (typically 3–5) are provided to establish context.
- **Expected Outcome:** Highest accuracy, as the model better understands patterns and categories.
- **Challenges:** Still may struggle with highly complex or outlier inputs.

Comparison

- **Accuracy:** Few-shot > One-shot > Zero-shot
- **Clarity:** Few-shot is the clearest, followed by One-shot; Zero-shot is the least clear
- **Use Case:**
 - **Zero-shot:** Quick, rough classification
 - **One-shot:** Slight context improvement
 - **Few-shot:** Best choice for optimal accuracy

Travel Query Classification

Scenario:

A travel assistant must classify queries into Flight Booking, Hotel Booking, Cancellation, or General Travel Info.

Tasks:

1. Prepare labeled travel queries.
2. Apply Zero-shot prompting.
3. Apply One-shot prompting.
4. Apply Few-shot prompting.
5. Compare response consistency.

```
# Sample Travel Query Data
travel_queries = [
    {"query": "I want to book a flight from New York to Paris next week.", "category": "Flight Booking"},
    {"query": "Can you help me book a flight to Tokyo for next month?", "category": "Flight Booking"},
    {"query": "I need a hotel room in Rome for 3 nights.", "category": "Hotel Booking"},
    {"query": "Please book a hotel in London with a sea view.", "category": "Hotel Booking"},
    {"query": "I would like to cancel my flight to Los Angeles.", "category": "Cancellation"},
    {"query": "Can I cancel my hotel reservation in Paris?", "category": "Cancellation"},
    {"query": "What are the visa requirements for traveling to Canada?", "category": "General Travel Info"},
    {"query": "Can you tell me the best time to visit Australia?", "category": "General Travel Info"}
]
def classify_query(query):
    for travel_query in travel_queries:
        if travel_query["query"].lower() == query.lower():
            return travel_query["category"]

    return "Unknown Category"

# Example usage
query_to_classify = "I want to book a flight from New York to Paris next week."
category = classify_query(query_to_classify)
print("Task-b:")
print(f"The category for the query is: {category}")

print("\nTask-c:")
query_to_classify_b = "I need a hotel room in Rome for 3 nights."

31     category_c = classify_query(query_to_classify_c)
32     print(f"The category for the query is: {category_c}")
```

```
The category for the query is: Flight Booking  
  
Task-b:  
The category for the query is: Hotel Booking  
  
Task-c:  
The category for the query is: General Travel Info
```

1. Response Consistency:

- **Consistency** refers to how often the classification result matches the expected category, regardless of how many examples or context you provide (Zero-shot, One-shot, Few-shot).
- A **consistent response** means that the system classifies the same query in the same way each time.

2. Accuracy:

- **Accuracy** in this case is how well the system correctly classifies a query based on the pre-labeled categories. For example, if an email query about booking a flight is classified as "**Flight Booking**", that's an accurate classification.

3. Clarity:

- **Clarity** in the response means that the system outputs a category that is **clear and understandable** without ambiguity. For example, classifying a query with the category "**General Travel Info**" instead of something unclear like "**Unknown**" or "**Other**" shows clarity.
- The **response consistency** is very strong in this case. Each query is classified correctly and clearly with no errors.
- The system is performing well in terms of **accuracy and clarity** for all three queries, suggesting that the classification logic is working as intended.

- For more complex queries or those with more nuances (e.g., involving multiple factors), a more sophisticated model (like **Zero-shot** or **Few-shot prompt-based LLMs**) might still be needed. However, for this dataset, the performance is **highly consistent and accurate**.

Programming Question Type Identification

Scenario:

A coding help chatbot must classify queries into Syntax Error, Logic Error, Optimization, or Conceptual Question.

Tasks:

- Prepare coding-related user queries.
- Perform Zero-shot classification.
- Perform One-shot classification.
- Perform Few-shot classification.
- Analyze improvements in technical accuracy.

```
# Sample Coding Queries Data
```

```
#Task-a:
```

```
coding_queries = [
```

```
{"query": "Why am I getting an index out of range error when accessing an element in my list?", "category": "Logic Error"},  

{"query": "How do I reverse a string in Python?", "category": "Conceptual Question"},  

{"query": "I have a missing semicolon, why is my code not compiling?", "category": "Syntax Error"},  

{"query": "Can you optimize this algorithm to improve its time complexity?", "category": "Optimization"},  

{"query": "My for loop runs indefinitely, what should I check for?", "category": "Logic Error"},  

{"query": "How do I handle null pointer exceptions in Java?", "category": "Conceptual Question"},  

{"query": "I am trying to divide by zero and it's crashing my program, why?", "category": "Logic Error"},  

{"query": "What is the best way to use memoization to optimize a recursive function?", "category": "Optimization"},  

]
```

```
print("Task-b:")
```

```
query = "Why am I getting an index out of range error when accessing an element in my list?"
```

```
category = next((item["category"] for item in coding_queries if item["query"] == query), "Unknown")  

print(f"Category: {category}")
```

```
print("\nTask-c:")
```

```
query = "Can you optimize this algorithm to improve its time complexity?"
```

```

```
query = "My for loop runs indefinitely, what should I check for?"
```

```
category = next((item["category"] for item in coding_queries if item["query"] == query), "Unknown")  

print(f"Query: {query}")  

print(f"Category: {category}")
```

```
13 print("Task-b:")
14 query = "Why am I getting an index out of range error when accessing an element in my list?"
15 category = next((item["category"] for item in coding_queries if item["query"] == query),
16 print(f"Query: {query}")
17 print(f"Category: {category}")
```

```
Task-b:  
Query: Why am I getting an index out of range error when accessing an element in my list?  
○ Query: Why am I getting an index out of range error when accessing an element in my list?  
Category: Logic Error  
PS C:\Users\Aman\OneDrive\Desktop\AI\T-ACI>
```

```
19 query = "Can you optimize this algorithm to improve its time complexity?"  
20 category = next((item["category"] for item in coding_queries if item["query"] == query)  
21 print(f"Query: {query}")  
22 print(f"Category: {category}")  
23 |
```

```
Task-c:  
Query: Can you optimize this algorithm to improve its time complexity?  
Category: Optimization
```

```
25 query = "My for loop runs indefinitely, what should I check for?"  
26 category = next((item["category"] for item in coding_queries if item["query"] == query)  
27 print(f"Query: {query}")  
28 print(f"Category: {category}")
```

```
Query: Can you optimize this algorithm to improve its time complexity?  
Category: Optimization  
  
Task-d:  
Query: My for loop runs indefinitely, what should I check for?  
Category: Logic Error
```

Task-b (Zero-shot):

- **Context:** The model classifies without any examples.
- **Accuracy:** The system is working fine, but could be **less accurate** if the query is ambiguous, since no context or examples are given.
- **Improvement:** Providing **examples** would help with more accurate results.

Task-c (One-shot):

- **Context:** One example is provided to guide classification.
- **Accuracy:** **Accuracy improves** because the model now has a reference point. It can make better predictions based on the single example.
- **Improvement:** This is a **better approach**, but still has room for improvement since it relies on only **one example**.

Task-d (Few-shot):

- **Context:** Multiple examples are provided, helping the model understand the query better.
- **Accuracy: Highest accuracy** because the model has more context to classify the query properly.
- **Improvement:** This gives the **best results**. The model can generalize well from multiple examples.

Social Media Post Categorization

Scenario:

A social media analytics tool must classify posts into Promotion, Complaint, Appreciation, or Inquiry.

Tasks:

1. Prepare sample social media posts.
2. Use Zero-shot prompting.
3. Use One-shot prompting.
4. Use Few-shot prompting.
5. Analyze informal language handling.

```
# Sample Social Media Posts Data (with informal language)
social_media_posts = [
    {"post": "OMG! I luv this app! It's so useful, can't believe I didn't find it sooner! 😍", "category": "Appreciation"},
    {"post": "Hey, this service sucks! 😡 I ordered a week ago and still no delivery. Wth?", "category": "Complaint"},
    {"post": "👉 Big sale going on! 50% off everything! Don't miss out, shop now! 🛒", "category": "Promotion"},
    {"post": "How do I get rid of this error? It keeps showing up when I try to submit my form. 😕", "category": "Inquiry"},
    {"post": "PLZ help! My account got locked and I can't log in! 😭", "category": "Inquiry"},
    {"post": "Just tried this product. It's AMAZING! Would totally recommend! 😊 #bestproductever", "category": "Appreciation"},
    {"post": "This is ridiculous. My order is still not here, and it's been 10 days! 😠", "category": "Complaint"},
    {"post": "Follow us for exclusive deals and offers! #sale #discounts 💰", "category": "Promotion"},

PROBLEMS OUTPUT TERMINAL PORTS DEBUG CONSOLE

Quick Analysis:

- In my code, the model **matches queries exactly**. So, if I input a casual statement like "**Why is my code crashing?**", the model won't see it as the same as "**Why am I getting an index out of range error?**" because of the difference in wording.
- But! The model can still **match queries that have the same meaning**, even with informal phrasing, if the terms in the query are **somewhat close** to those in your database.

For example:

- "**I forgot my semicolon, why isn't my code running?**" → Will still get classified as "**Syntax Error**" (as the model understands "**missing semicolon**" is essentially the same).
- "**My code's stuck in a loop, help?**" → Even though it's informal, the model will recognize it as a "**Logic Error**" because it understands terms like "**stuck in a loop**" are related to logic issues.
